

Project Design Phase

Problem – Solution Fit Template

Date	04 October 2026
Team ID	SWTID-2026-1268
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	2 Marks

Problem – Solution Fit Template:

The Problem-Solution Fit means that you have found a problem with your customer and that the solution you have realized for it actually solves the customer's problem. The canvas on the next page applies this to the Script-Controlled ACL project, where access to each record depends on the value of a field in that record.

Purpose:

- Solve complex problems in a way that fits the state of your customers.
- Succeed faster and increase your solution adoption by tapping into existing mediums and channels of behavior.
- Sharpen your communication and marketing strategy with the right triggers and messaging.
- Increase touch-points with your company by finding the right problem-behavior fit and building trust by solving frequent annoyances, or urgent or costly problems.
- Understand the existing situation in order to improve it for your target group.

Problem – Solution Fit Canvas

1. CUSTOMER SEGMENT(S) [CS] - Administrators and data owners of a ServiceNow instance (IT, HR, Finance teams) - Employees who need access only to records of their own department or group - Security auditors and compliance officers	6. CUSTOMER CONSTRAINTS [CC] - Limited scripting skills among administrators - Table-level roles are too broad for record-level needs - Rules must not slow down lists or break existing access - Limited time and budget for testing and changes	5. AVAILABLE SOLUTIONS [AS] - Role-only table ACLs: simple, but give access to every record - Separate tables per department: hard to maintain and report on - Hiding fields in the UI only: not secure, URL/API still open - Manual checks and approvals: slow and error-prone
2. JOBS-TO-BE-DONE / PROBLEMS [J&P] - Show each user only the records they are permitted to see - Stop restricted records being opened by URL or API - Hide or mask sensitive fields - Prove who accessed or was denied which record	9. PROBLEM ROOT CAUSE [RC] - Table roles apply to the whole table, not to individual records - Sensitive and non-sensitive records sit in the same table - Privacy and audit requirements demand record-level control - No simple way to base access on a field value without scripting	7. BEHAVIOUR [BE] - Admins create roles and ACLs, test with Impersonate User, and review logs - Users browse lists, search records and share record links - Staff may export data or copy links when access is too open
3. TRIGGERS [TR] - A data leak scare or audit finding - New department or sensitive data added to a table - Privacy rules or complaints that staff see others' records	10. YOUR SOLUTION [SL] - A script-controlled ACL: the script reads the record's field value (e.g. Department) and compares it with the user's roles and attributes - Access is denied by default; script errors deny access - Works for lists, forms, reports and API calls - Sensitive fields can be masked; reusable script includes - Audit log of allowed and denied attempts - Fits constraints: no extra tool, rules editable by admins	8.1. CHANNELS OF BEHAVIOUR – ONLINE [CH] - ServiceNow lists, forms and Service Portal - Impersonate User for testing; REST API calls - ServiceNow documentation and community
4. EMOTIONS: BEFORE / AFTER [EM] - Before: worried, exposed, unsure who can see what - After: confident, in control, trust in the system		8.2. CHANNELS OF BEHAVIOUR – OFFLINE [CH] - Meetings with department heads and data owners - Security and compliance review meetings - Training and hand-over sessions
