| Project Name  | Script-Controlled ACL – Restrict Record Access Based on Field Value |
| Maximum Marks | 2 Marks                                                             |

### Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

| S.No. | Parameter                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.    | <b>Problem Statement<br/>(Problem to be solved)</b> | Table-level roles give a user access to every record in a table, even when some records are meant only for one department or group. Administrators need a way to decide access for each record using a value in that record, so that sensitive records cannot be seen through lists, direct URLs or API calls.                                                                                                                                                         |
| 2.    | <b>Idea / Solution<br/>description</b>              | Use a script-controlled Access Control List (ACL) on the ServiceNow platform. The ACL script reads the record's controlling field (for example, Department), compares it with the logged-in user's roles and attributes, and returns true (allow) or false (deny). Access is denied by default and script errors deny access. Sensitive fields can be masked, shared logic is kept in script includes, and every allowed or denied attempt is written to an audit log. |
| 3.    | <b>Novelty / Uniqueness</b>                         | Access depends on the data inside each record, not only on the user's role. One reusable script covers lists, forms, reports and the API, rules can be changed or switched off by administrators without rebuilding the application, and the fail-safe (deny by default) design avoids accidental exposure. It needs no extra tool beyond the platform.                                                                                                                |
| 4.    | <b>Social Impact / Customer<br/>Satisfaction</b>    | Protects personal and sensitive information of employees and customers, supports privacy and audit requirements, and builds trust. Administrators gain confidence and control; users see only what concerns them and get a clear access denied message instead of confusing errors.                                                                                                                                                                                    |
| 5.    | <b>Business Model<br/>(Revenue Model)</b>           | Delivered as a reusable application or accelerator for ServiceNow customers. Possible revenue: a one-time implementation or setup fee, a yearly support and maintenance subscription, and paid add-ons such as policy templates, a no-code rule builder and audit dashboards.                                                                                                                                                                                          |
| 6.    | <b>Scalability of the<br/>Solution</b>              | Runs on the platform's multi-tier cloud architecture, so more users, tables and records can be added without redesign. New protected tables only need a new ACL and field condition, and shared script includes keep scripts light. Performance is protected by evaluating simple conditions before scripts and by indexing the fields used in conditions.                                                                                                             |
