

Project Development Phase Model Performance Test

Date	04 October 2026
Team ID	SWTID-2026-1268
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	

Model Performance Testing:

Project team shall fill the following information in model performance testing template.

S.No.	Parameter	Values	Screenshot
1.	Model Summary	No trained model is used. Access decisions are made by a rule-based ACL script: the script reads the record's field value (e.g. Department) and the current user's roles, then returns true (allow) or false (deny). Access is denied by default, and script errors fail safe by denying access.	<i>[Insert screenshot of the ACL script]</i>
2.	Accuracy	Training Accuracy - Not applicable (no training) Validation Accuracy - Not applicable Access-decision accuracy in testing - 100% (13 of 13 UAT test cases gave the expected allow / deny result)	<i>[Insert screenshot of test results]</i>
3.	Fine Tuning Result (if done)	Not applicable. Rule refinement after testing: empty-field handling added to the script and the read operation covered by the ACL; all retests passed. Validation Accuracy - Not applicable (decision accuracy remained 100% after fixes).	<i>[Insert screenshot of retest results]</i>

Note:

This project is a rule-based ServiceNow access-control solution. It uses an ACL script that compares a record's field value with the user's roles, not a trained AI/ML model, so training, validation and tuning values do not apply. The decision-accuracy and confusion-matrix figures in the table are sample values from planned test checks; replace them with your actual test results and add screenshots.
