

Project Development Phase Model Performance Test

Date	04 October 2026
Team ID	SWTID-2026-1268
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	10 Marks

Model Performance Testing:

Project team shall fill the following information in model performance testing template.

S.No.	Parameter	Values	Screenshot
1.	Metrics	Regression Model: Not applicable (the solution does not predict a numeric value, so MAE, MSE, RMSE and R2 score are not used). Classification Model: The allow / deny decision is treated as a two-class outcome on 20 sample access checks (10 that should be allowed, 10 that should be denied). Confusion Matrix - True Allow = 10, True Deny = 10, False Allow = 0, False Deny = 0 Accuracy Score - 1.00 (100%) Classification Report - Precision 1.00, Recall 1.00, F1-score 1.00 for both Allow and Deny	<i>[Insert screenshot of test results]</i>
2.	Tune the Model	Hyperparameter Tuning - Not applicable (rule-based; no hyperparameters). Rules were refined after testing instead (empty-field check, read operation covered by the ACL). Validation Method - Role × field-value test matrix: each role (HR, Finance, administrator, auditor) tested against records with matching, non-matching and empty field values.	<i>[Insert screenshot of the test matrix]</i>

Note:

This project is a rule-based ServiceNow access-control solution. It uses an ACL script that compares a record's field value with the user's roles, not a trained AI/ML model, so training, validation and tuning values do not apply. The decision-accuracy and confusion-matrix figures in the table are sample values from planned test checks; replace them with your actual test results and add screenshots.
